Projects

Ransomware Detector - Built a hybrid ML–DL ensemble to detect and classify 26 ransomware families using static & dynamic features. - Applied model stacking, achieving ~97% accuracy with real-time detection against evolving threats.	PhishGuard – AI-Driven Phishing Detection - Implemented phishing detection using TF-IDF + LR, Naive Bayes, Random Forest. - Integrated SBERT embeddings for contextual email understanding. - Designed a recall-optimized hybrid pipeline and generated synthetic phishing data using GPT-2.
Facial Recognition Attendance System - Developed a real-time facial recognition system using OpenCV and scikit-learn. - Automated data splitting, training, and new user registration with optimized live inference.	Intrusion Detection System (DNS) - Built an end-to-end ML pipeline for malicious DNS traffic detection. - Processed DNS queries using Regex + TF-IDF and trained a Logistic Regression model. - Deployed real-time detection with latency tracking and performance evaluation.
